

Working Prototype Known Problems Report - Web
FitTrak
Trainers
11/30/2019

- In order to create an appointment with a respective client, once must click on their “badge”/ client “banner”
 - For possible solutions, we could implement a method to automatically update the local database with the respective clients every time a new user is “pushed” into the shared database.
- If the text is too long, the workout description text may leak into the banner graphic
 - For possible solutions, we could simplify the graphic or add larger margins to prevent the leak over
- If one creates another user profile with an existing one, the newest profile will leak over in the view and only the newest profile will update in the shared Android/Web database.
 - For possible solutions, we could implement a boolean to determine if a profile has already been created
- Trainer Users can still create Workouts/Appointments/View Clients even if a Trainer profile has not been created, this results in either an error or the database not updating with the required information.
 - We could remove these buttons and prompt the user to create a profile immediately after signing up with an email.
